THE
TUTOR'S ASSISTANT;
BEING A
COMPENDIUM OF ARITHMETIC,
AND
COMPLETE QUESTION-BOOK;
CONTAINING,

I. Arithmetic in whole numbers; being a brief explanation of all its Rules, in a new and more concise method than any hitherto published; with an Application to each Rule, consisting of a great variety of questions in real Business, with their answers annexed.

II. Vulgar Fractions, which are treated with a great deal of plainness and perspicuity.

III. Decimals, with the extraction of the Square, Cube, and Biquadrate Roots, after a very plain and familiar manner; to which are added, Rules for the easy calculation of Interest, Annuities, and Pensions in arrears, &c., either by Simple or Compound Interest.

IV. Duodecimals, or Multiplication of Feet and Inches, with Examples applied to measuring and working by Multiplication, Practice, and Decimals.

V. A Collection of Questions, promiscuously arranged, for the exercise of the scholar in the foregoing rules.

TO WHICH ARE ADDED,

A new and very short method of extracting the Cube Root, and a General Table for readily calculating the Interest of any sum of money, at any rate per cent.; Rents, Salaries, &c.

The whole being adapted either as a Question-Book for the use of Schools, or as a Remembrancer and Instructor to such as have some knowledge of Accounts.

This Work having been perused by several eminent Mathematicians and Accountants, is recommended as the best Compendium hitherto published, for the use of Schools, or for private persons.

BY FRANCIS WALKINGAME,

WRITING-MASTER AND ACCOUNTANT.

TO WHICH IS ADDED,

A COMPENDIUM OF BOOK-KEEPING,
BY ISAAC FISHER.

P R E F A C E .

THE public, no doubt, will be surprised to find there is another attempt made to publish a book of ARITHMETIC, when there are such numbers already extant on the same subject, and several of them that have so lately made their appearance in the world ; but I flatter myself, that the following reasons which induced me to compile it, the method, and the conciseness of the rules, which are laid down in so plain and familiar a manner, will have some weight towards its having a favourable reception.

Having some time ago drawn up a set of rules and proper questions, with their answers annexed, for the use of my own school, and divided them into several books, as well for more ease to myself, as the readier improvement of my scholars, I found them, by experience, of infinite use ; for when a master takes upon him that laborious, (though unnecessary,) method of writing out the rules and questions in the children's books, he must either be toiling and slaving himself after the fatigue of the school is over, to get ready the books for the next day, or else must lose that time which would be much better spent in instructing and opening the minds of his pupils. There was, however, still an inconvenience which hindered them from giving me the satisfaction I at first expected ; *i. e.* where there are several boys in a class, some one or other must wait till the boy who first has the book, finishes the writing out of those rules or questions he wants, which detains the others from making that progress they otherwise might, had they a proper book of rules and examples for each ; to remedy which, I was prompted to compile one in order to have it printed, that might not only be of use to my own school, but to such others as would have their scholars make a quick progress. It will also be of great use to such gentle-

men as have acquired some knowledge of numbers at school to make them the more perfect ; likewise to such as have completed themselves therein, it will prove, after an impartial perusal, on account of its great variety and brevity, a most agreeable and entertaining exercise-book. I shall not presume to say any thing more in favour of this work, but beg leave to refer the unprejudiced reader to the remark of a certain author,* concerning compositions of this nature. His words are as follows :—

“ And now, after all, it is possible that some who like best to tread the old beaten path, and to sweat at their business, when they may do it with pleasure, may start an objection, against the use of this well-intended Assistant, because the course of arithmetic is always the same ; and therefore say, that some boys lazily inclined, when they see another at work upon the same question, will be apt to make his operation pass for their own. But these little forgeries are soon detected by the diligence of the tutor : therefore, as different questions to different boys do not in the least promote their improvement, so neither do the questions hinder it. Neither is it in the power of any master (in the course of his business) how full of spirits soever he be, to frame new questions at pleasure in any rule : but the same question will frequently occur in the same rule, notwithstanding his greatest care and skill to the contrary.

“ It may also be further objected, that to teach by a printed book is an argument of ignorance and incapacity ; which is no less trifling than the former. He, indeed, (if any such there be,) who is afraid his scholars will improve too fast, will, undoubtedly, decry this method : but that master’s ignorance can never be brought in question, who can begin and end it readily ; and, most certainly, that scholar’s non-improvement can be as little questioned, who makes a much greater progress by this, than by the common method.”

To enter into a long detail of every rule, would tire the reader, and swell the preface to an unusual length ; I shall, therefore, only give a general idea of the method of proceeding, and leave the rest to speak for itself ; which I hope the kind reader will find to answer the title, and the recommendation given it. As

to the rules, they follow in the same manner as the table of contents specifies, and in much the same order as they are generally taught in schools. I have gone through the four fundamental rules in Integers first, before those of the several denominations; in order that they being well understood, the latter will be performed with much more ease and dispatch, according to the rules shown, then by the customary method of dotting. In multiplication I have shown both the beauty and use of that excellent rule, in resolving most questions that occur in merchandising; and have prefixed before Reduction, several Bills of Parcels, which are applicable to real business. In working Interest by Decimals, I have added tables to the rules, for the readier calculating of Annuities, &c. and have not only shown the use, but the method of making them: as likewise an Interest Table, calculated for the easier finding of the Interest of any sum of money at any rate per cent. by Multiplication and Addition only; it is also useful in calculating Rates, Incomes, and Servants' Wages, for any number of months, weeks, or days; and I may venture to say, I have gone through the whole with so much plainness and perspicuity, that there is none better extant.

I have nothing further to add, but a return of my sincere thanks to all those gentlemen, schoolmasters, and others, whose kind approbation and encouragement have now established the use of this book in almost every school of eminence throughout the kingdom: but I think my gratitude more especially due to those who have favoured me with their remarks; though I must still beg of every candid and judicious reader, that if he should, by chance, find a transposition of a letter, or a false figure, to excuse it; for, notwithstanding there has been great care taken in correcting, yet errors of the press will inevitably creep in; and some may also have slipped my observation; in either of which cases the admonition of a good-natured reader will be very acceptable to his much obliged, and most obedient humble servant,

F. WALKINGAME.

EXPLANATION OF THE CHARACTERS MADE USE OF IN
THIS COMPENDIUM.

| | |
|-----------------------------|--|
| =Equal. | The Sign of Equality ; as, $4 \text{ qrs.} = 1 \text{ cwt.}$ signifies that 4 qrs. are equal to 1 cwt. |
| —Minus, or Less. | The Sign of Subtraction ; as, $8 - 2 = 6$, that is, 8 lessened by 2 is equal to 6. |
| + Plus, or More. | The Sign of Addition ; as $4 + 4 = 8$, that is, 4 added to 4 more, is equal to 8. |
| × Multiplied by. | The Sign of Multiplication ; as, $4 \times 6 = 24$, that is, 4 multiplied by 6 is equal to 24. |
| ÷ Divided by. | The Sign of Division ; as, $8 \div 2 = 4$, that is, 8 divided by 2 is equal to 4. |
| $\frac{2357}{63}$ | Numbers placed like a fraction do likewise denote Division ; the upper number being the dividend, and the lower the divisor. |
| :: So is. | The Sign of Proportion ; as, $2 : 4 :: 8 : 16$, that is, as 2 is to 4, so is 8 to 16. |
| $7 - 2 + 5 = 10.$ | Shows that the difference between 2 and 7 added to 5, is equal to 10. |
| $9 - \overline{2 + 5} = 2.$ | Signifies that the sum of 2 and 5 taken from 9, is equal to 2. |
| ✓ | Prefixed to any number, signifies the Square Root of that number is required. |
| ✓ ³ | Signifies the Cube, or Third Power. |

RULE. There are three periods ; the first on the right hand, Units ; the second, Thousands ; and the third, Millions ; each consisting of three Figures, or Places. Reckon the first Figure of each from the left hand as so many Hundreds, the next as 'Tens, and the third as so many single ones of what is written over them : thus, the first Period on the left hand is read, Nine Hundred and Eighty-seven Millions ; and so on for any of the rest.

THE APPLICATION.

Write down in proper Figures the following Numbers.

- (¹) Twenty-three.
- (²) Two hundred and Fifty-four.
- (³) Three Thousand, Two Hundred and Four.
- (⁴) Twenty-five Thousand, Eight Hundred and Fifty-six.
- (⁵) One Hundred and Thirty-two Thousand, Two Hundred and Forty-five.

ADDITION

Teacheth to add two or more Sums together, to make one whole or total Sum.

RULE. There must be due regard had in placing the Figures one under the other, *i. e.* Units under Units, Tens under Tens, &c.; then beginning with the first row of Units, add them up to the top; when done, set down the Units, and carry the Tens to the next, and so on; continuing to the last row, under which set down the Total amount.

PROOF. Begin at the top of the Sum, and reckon the Figures downwards, the same as you add them up, and, if the same as the first, the Sum is supposed to be right.

SUBTRACTION

Teacheth to take a less Number from a greater, and shows the remainder or difference.

RULE. This being the reverse of Addition, you must borrow here (if it require) what you stopped at there, always remembering to pay it to the next.

PROOF. Add the Remainder and the less Line together, and if the same as the greater, it is right.

MULTIPLICATION

Teacheth how to increase the greater of two Numbers given as often as there are Units in the less ; and compendiously performs the office of many additions.

To this Rule belong three principal Members, viz.

1. The Multiplicand, or Number to be multiplied.
2. The Multiplier, or number by which you multiply.
3. The Product, or Number produced by multiplying.

RULE. Begin with that Figure which stands in the Unit's place of the Multiplier, and with it multiply the first Figure in the Unit's place of the Multiplicand. Set down the Units, and carry the Tens in mind, till you have multiplied the next Figure in the Multiplicand by the same Figure in the Multiplier; to the product of which add the Tens you kept in mind, setting down the Units, and proceed as before, till the whole line is multiplied.

PROOF. By casting out the Nines; or make the former Multiplicand the Multiplier, and the Multiplier the Multiplicand; and if the Product of this operation be the same as before, the work is right.

When the Multiplier is more than 12, and less than 20, multiply by the Unit Figure in the Multiplier, adding to the Product the back Figure to that you multiplied.

When the Multiplier consists of several Figures, there must be as many products as there are Figures in the Multiplier, observing to put the first figure of every Product under that Figure you multiply by. Add the several Products together, and their Sum will be the total Product.

When Ciphers are placed between the significant Figures in the Multiplier, they may be omitted; but great care must be taken that the next Figure must be put one place more to the left hand, *i. e.* under the Figure you multiply by.

When there are Ciphers at the end of the Multiplicand or Multiplier, they may be omitted, by only multiplying by the rest of the Figures, and setting down on the right hand of the total Product as many Ciphers as were omitted.

DIVISION

Teacheth to find how often one Number is contained in another; or, to divide any Number into what parts you please.

In this Rule there are three numbers real, and a fourth accidental: viz.

1. The Dividend, or Number to be divided:
2. The Divisor, or Number by which you divide:
3. The Quotient, or Number that shows how often the Divisor is contained in the Dividend:
4. Or accidental Number, is what remains when the work is finished, and is of the same name as the Dividend.

RULE. When the Divisor is less than 12, find how often it is contained in the first Figure of the Dividend; set it down under the Figure you divided, and carry the Overplus (if any) to the next in the Dividend, as so many Tens; then find how often the Divisor is contained therein, set it down, and continue the same

till you have gone through the Line; but when the Divisor is more than 12, multiply it by the Quotient Figure; the Product subtract from the Dividend, and to the Remainder bring down the next Figure in the Dividend and proceed as before, till the Figures are all brought down.

PROOF. Multiply the Divisor and Quotient together, adding the Remainder, (if any,) and the Product will be the same as the Dividend.

When the Divisor is a composite number, *i. e.* if any two Figures, being multiplied together, will make that Number, then, by dividing the Dividend by one of those Figures, and that Quotient by the other, it will give the Quotient required. But as it sometimes happens, that there is a Remainder to each of the Quotients, and neither of them the true one, it may be found by this

RULE. Multiply the first Divisor into the last Remainder, to that Product add the first Remainder, which will give the true one.

* By a late Act of Parliament, the capacities of the Wine, the Ale and Beer, and the Dry Measures, have been reduced to one Standard. For an accurate comparison of these Measures, with the old standard Measures, the Student is referred to the Table of the "Imperial Measures," at the beginning of the work.

In London they compute but 8 gallons to the firkin of Ale, and 32 to the barrel; but in all other parts of England, for ale, strong beer and small, 34 gallons to the barrel, and $8\frac{1}{2}$ gallons to the firkin.

N.B.—A barrel of salmon, or eels, is 42 gallons.

A barrel of herrings 32 gallons.

A keg of sturgeon 4 or 5 gallons.

A firkin of soap 8 gallons.

THE SINGLE RULE OF THREE DIRECT.

Teacheth by three numbers given to find out a fourth, in such proportion to the third, as the second is to the first.

RULE. First state the question, that is, place the numbers in such order, that the first and third be of one kind, and the second the same as the number required; then bring the first and third numbers into one name, and the second into the lowest term mentioned. Multiply the second and third numbers together, and

divide the product by the first, and the quotient will be the answer to the question in the same denomination you left the second number in.

EXAMPLES.

INVERSE PROPORTION is, when more requires less, and less requires more. More requires less, is when the third term is greater than the first, and requires the fourth term to be less than the second. And less requires more, is when the third term is less than the first, and requires the fourth term to be greater than the second.

RULE.—Multiply the first and second terms together, and divide the product by the third, the quotient will bear such proportion to the second as the first does to the third.

THE DOUBLE RULE OF THREE,

Is so called because it is composed of 5 numbers given to find a 6th, which, if the proportion is direct, must bear such a proportion to the 4th and 5th, as the 3d bears to the 1st and 2d. But if inverse, the 6th number must bear such proportion to the 4th and 5th, as the 1st bears to the 2d and 3d. The three first terms are a supposition; the two last, a demand.

RULE 1. Let the principal cause of loss or gain, interest or decrease, action or passion, be put in the first place.

2. Let that which betokeneth time, distance of place, and the like, be in the second place, and the remaining one in the third.

3. Place the other two terms under their like in the supposition.

4. If the blank falls under the third term, multiply the first and second terms for a divisor, and the other three for a dividend. But,

5. If the blank falls under the first or second term, multiply the third and fourth terms for a divisor, and the other three for the dividend, and the quotient will be the answer.

PRACTICE,

Is so called from the general use thereof by all persons concerned in trade and business.

All questions in this rule are performed by taking aliquot, or even parts, by which means many tedious reductions are avoided, the table of which is as follows:—

| Of a Pound. | Of a shilling. | Of a Ton. | Of a Hundred. |
|---------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| s. d. | d | cwt. | qrs. lb. |
| 10 : 0 ... is ... $\frac{1}{2}$ | 6 is $\frac{1}{2}$ | 10 is $\frac{1}{2}$ | 2 or 56 is $\frac{1}{2}$ |
| 6 : 8 $\frac{1}{3}$ | 4 $\frac{1}{3}$ | 5 $\frac{1}{4}$ | 1 or 28 $\frac{1}{4}$ |
| 5 : 0 $\frac{1}{4}$ | 3 $\frac{1}{4}$ | 4 $\frac{1}{5}$ | 14 $\frac{1}{9}$ |
| 4 : 0 $\frac{1}{5}$ | 2 $\frac{1}{6}$ | 2 $\frac{1}{2}$ $\frac{1}{8}$ | Of a Quarter. |
| 3 : 4 $\frac{1}{6}$ | 1 $\frac{1}{2}$ $\frac{1}{8}$ | 2 $\frac{1}{10}$ | 14 lb $\frac{1}{2}$ |
| 2 : 6 $\frac{1}{8}$ | 1 $\frac{1}{12}$ | | 7 $\frac{1}{4}$ |
| 2 : 0 $\frac{1}{10}$ | | | 4 $\frac{1}{7}$ |
| 1 : 8 $\frac{1}{12}$ | | | 3 $\frac{1}{2}$ $\frac{1}{9}$ |

RULE 1. When the price is less than a penny, divide by the aliquot parts that are in a penny; then by 12 and 20, it will be the answer.

FELLOWSHIP

Is when two or more join their stock and trade together, so to determine each person's particular share of the gain or loss, in proportion to his principal in joint stock.

By this rule a bankrupt's estate may be divided amongst his creditors; as also legacies may be adjusted when there is a deficiency of assets or effects.

FELLOWSHIP IS EITHER WITH OR WITHOUT TIME.

FELLOWSHIP WITHOUT TIME.

RULE. As the whole stock : is to the whole gain or loss :: so is each man's share in stock : to his share of the gain or loss.

PROOF. Add all the shares together, and the sum will be equal to the given gain or loss--but the surest way is, as the whole gain or loss : is to the whole stock :: so is each man's share of the gain or loss : to his share in stock.

EXAMPLES.

ALLIGATION ALTERNATE

Is when the price of several things are given, to find such quantities of them to make a mixture, that may bear a price propounded.

In ordering the rates and the given price, observe,

| | | | | |
|--------------------------------------|---------------------------------|----|-------|---|
| 1. | Place them one under the other, | 18 | | 2 |
| and the propounded price or mean | 22 | 20 | | 6 |
| rate at the left hand of them, thus, | 22 | 24 | | 4 |
| | 28 | | | 2 |

2. Link the several rates together by 2 and 2, always observing to join a greater and a less than the mean.

3. Against each extreme place the difference of the mean and its yoke fellow.

When the prices of the several simples and the mean rate are given without any quantity, to find how much of each simple is required to compose the mixture.

RULE. Take the difference between each price and the mean rate, and set them alternately, they will be the answer required.

PROOF. By Alligation Medial.

EXAMPLES.

1. A vintner would mix four sorts of wine together, of 18d., 20d., 24d., and 28d. per quart, what quantity of each must he have, to sell the mixture at 22d. per quart?

Answer.

| | | |
|----|-------------|------|
| 18 | 2 of 18d. = | 36d. |
| 20 | 6 of 20d. = | 120 |
| 24 | 4 of 24d. = | 96 |
| 28 | 2 of 28d. = | 56 |
| — | — | — |
| 14 |)308 | |
| | — | |
| | 22d. | |

Proof.

or thus,

| | | |
|----|-------------|-------|
| 18 | 6 of 18d. = | 108d. |
| 20 | 2 of 20d. = | 40 |
| 24 | 2 of 24d. = | 48 |
| 28 | 4 of 28d. = | 112 |

POSITION, OR THE RULE OF FALSE,

Is a rule that by false or supposed numbers, taken at pleasure discovers the true one required. It is divided into two parts, SINGLE and DOUBLE.

SINGLE POSITION

Is, by using one supposed number, and working with it as the true one, you find the real number required, by the following

RULE. As the total of the errors : is to the true total :: so is the supposed number : to the true one required.

PROOF. Add the several parts of the sum together, and if it agrees with the sum it is right.

EXAMPLES.

1. A schoolmaster being asked how many scholars he had, said, If I had as many, half as many, and one quarter as many more, I should have 88. How many had he? *Ans. 32.*

$$\begin{array}{rccccc}
 \text{Suppose he had...} & 40 & \text{As } 110 : 88 :: 40 & 32 \\
 \text{as many.....} & 40 & & 40 & 32 \\
 \text{half as many} & 20 & & & 16 \\
 \frac{1}{4} \text{ as many....} & 10 & & 11|0)352|0(32 & 8 \\
 \hline & & & 33 & \\
 & 110 & & \hline & 88 \text{ proof.} \\
 & & & 22 & \\

 \end{array}$$

Ans. Horse £13:6:8, Harness £6:13:4, Chaise £40.

4. A, B, and C, being determined to buy a quantity of goods which would cost them £120, agreed among themselves that B should have a third part more than A, and C a fourth part more than B. I desire to know what each man must pay?

Ans. A £30, B £40, C £50.

5. A person delivered to another a sum of money unknown, to receive interest for the same, at 6 per cent per annum, simple interest, and at the end of 10 years received, for principal and interest, £300. What was the sum lent? *Ans.* £187 : 10.

DOUBLE POSITION

Is by making use of two supposed numbers, and if both prove false, (as it generally happens) they are, with their errors, to be thus ordered:—

RULE 1. Place each error against its respective position.

2. Multiply them cross-ways.

3. If the errors are alike, *i. e.* both greater, or both less than the given number, take their difference for a divisor, and the difference of the products for a dividend. But if unlike, take their sum for a divisor, the sum of their products for a dividend, the quotient will be the answer.

EXAMPLES.

1. A, B, and C, would divide £200 between them, so that B may have £6 more than A, and C £8 more than B; how much must each have?

Suppose A had 40

When it is required to find how many of the first sort of coin, weight, or measure, mentioned in the question, are equal to a given quantity of the last.

RULE. Place the numbers alternately, beginning at the left hand, and let the last number stand on the left hand; then multiply the first row continually for a dividend, and the second for a divisor.

PROGRESSION

CONSISTS OF TWO PARTS,

ARITHMETICAL AND GEOMETRICAL.

ARITHMETICAL PROGRESSION

Is when a rank of numbers increase or decrease regularly by the continual adding or subtracting of equal numbers ; as 1, 2, 3, 4, 5, 6, are in Arithmetical Progression by the continual increasing or adding of one ; 11, 9, 7, 5, 3, 1, by the continual decreasing or subtracting of two.

NOTE. When any even number of terms differ by Arithmetical Progression, the sum of the two extremes will be equal to the two middle numbers, or any two means equally distant from the extremes : as 2, 4, 6, 8, 10, 12, where $6+8$, the two middle numbers, are = $12+2$, the two extremes, and = $10+4$ the two means = 14.

When the number of terms are odd, the double of the middle term will be equal to the two extremes ; or of any two means equally distant from the middle term ; as 1, 2, 3, 4, 5, where the double number of $3=5+1=2+4=6$.

In Arithmetical Progression five things are to be observed, viz.

1. The first term ; better expressed thus, F.
2. The last term, L.
3. The number of terms, N.
4. The equal difference, D.
5. The sum of all terms, S.

Any three of which being given, the other two may be found. The first, second, and third terms given, to find the fifth.

RULE. Multiply the sum of the two extremes by half the number of terms, or multiply half the sum of the two extremes

by the whole number of terms, the product is the total of all the terms : or thus,

I. F L N are given to find S.

$$\begin{array}{r} \text{N} \\ \hline F+L\times\frac{\text{---}}{2}=S. \end{array}$$

EXAMPLES.

1. How many strokes does the hammer of a clock strike in 12 hours?

$$12+1=13, \text{ then } 13\times 6=78.$$

2. A man bought 17 yards of cloth, and gave for the first yard 2s, and for the last 10s. what did the 17 yards amount to?

Ans. £5, 2.

3. If 100 eggs were placed in a right line, exactly a yard apart from one another, and the first a yard from a basket, what length of ground does that man go who gathers up these 100 eggs singly, and returns with every egg to the basket to put it in?

Ans. 5 miles, 1300 yards.

The first, second, and third terms given, to find the fourth.

RULE. From the second subtract the first, the remainder divided by the third less one, gives the fourth : or thus

II. F L N are given to find D.

$$\begin{array}{r} L-F \\ \hline \frac{\text{---}}{N-1}=D. \end{array}$$

EXAMPLES.

4. A man had eight sons, the youngest was 4 years old, and the eldest 32, they increase in Arithmetical Progression, what was the common difference of their ages? *Ans.* 4.

$$32-4=28, \text{ then } 28\div 8-1=4 \text{ common difference.}$$

5. A man is to travel from London to a certain place in 12 days, and to go but 3 miles the first day, increasing every day by an equal excess, so that the last day's journey may be 68 miles,

what is the daily increase, and how many miles distant is that place from London? *Ans. 5* daily increase.

Therefore, as three miles is the first day's journey,

$$3+5=8 \text{ the second day.}$$

$$8+5=13 \text{ the third day, &c.}$$

The whole distance is 366 miles.

The first, second, and fourth terms given, to find the third.

RULE. From the second subtract the first, the remainder divide by the fourth, and to the quotient add 1, gives the third; or thus,

III. **F L D** are given to find **N**.

$$\begin{array}{r} L-F \\ \hline D \end{array} - + 1 = N.$$

EXAMPLES.

6. A person travelling into the country, went 3 miles the first day, and increased every day 5 miles, till at last he went 58 miles in one day; how many days did he travel? *Ans. 12.*

$$58-3=55+5=11+1=12 \text{ the number of days.}$$

7. A man being asked how many sons he had, said, that the youngest was 4 years old, and the oldest 32; and that he increased one in his family every 4 years, how many had he?

$$Ans. 8.$$

The second, third, and fourth terms given to find the first

RULE. Multiply the fourth by the third made less by one, the product subtracted from the second gives the first: or thus,

IV. **L N D** are given to find **F**.

$$\overline{L-D \times N-1=F.}$$

EXAMPLES.

8. A man in 10 days went from London to a certain town in the country, every day's journey increasing the former by 4, and the last he went was 46 miles, what the first?

$$Ans. 10 \text{ miles.}$$

$$4 \times 10 - 1 = 36, \text{ then } 46 - 36 = 10, \text{ the first day's journey.}$$

9. A man takes out of his pocket at 8 several times, so many different numbers of shillings, every one exceeding the former by 6, the last at 46; what was the first? *Ans. 4.*

The fourth, third, and fifth given, to find the first.

RULE., Divide the fifth by the third, and from the quotient subtract half the product of the fourth multiplied by the third less 1 gives the first: or thus,

V N D S are given to find F

$$\frac{S D \times N - 1}{N^2} - F.$$

EXAMPLES.

10. A man is to receive £360 at 12 several payments, each to exceed the former by £4, and is willing to bestow the first payment on any one that can tell him what it is. What will that person have for his pains? *Ans. £8.*

$$360 \div 12 = 30, \text{ then } 30 - \frac{4 \times 12 - 1}{2} = \text{£8 the first payment.}$$

The first, third, and fourth, given to find the second.

RULE. Subtract the fourth from the product of the third, multiplied by the fourth, that remainder added to the first gives the second: or thus,

VI. F N D are given to find L.

$$ND - D + F = L$$

EXAMPLES.

11. What is the last number of an Arithmetical Progression, beginning at 6, and continuing by the increase of 8 to 20 places?

Ans. 158.

$$20 \times 8 - 8 = 152, \text{ then } 152 + 6 = 158, \text{ the last number.}$$

GEOMETRICAL PROGRESSION

Is the increasing or decreasing of any rank of numbers by some common ratio; that is, by the continual multiplication or division of some equal number: as 2, 4, 8, 16, increase by the multiplier 2, and 16, 8, 4, 2, decrease by the divisor 2.

NOTE. When any number of terms is continued in Geometrical Progression, the product of the two extremes will be equal to any two means, equally distant from the extremes : as 2, 4, 8, 16, 32, 64, where $64 \times 2 = 4 \times 32$, and $8 \times 16 = 128$.

When the number of the terms are odd, the middle term multiplied into itself will be equal to the two extremes, or any two means equally distant from it, as 2, 4, 8, 16, 32, where $2 \times 32 = 4 \times 16 = 8 \times 8 = 64$.

In Geometrical Progression the same 5 things are to be observed as are in Arithmetical, viz.

1. The first term.
2. The last term.
3. The number of terms.
4. The equal difference or ratio.
5. The sum of all the terms.

NOTE. As the last term in a long series of numbers is very tedious to come at, by continual multiplication ; therefore, for the reader finding it out, there is a series of numbers made use of in Arithmetical Proportion, called indices, beginning with an unit, whose common difference is one ; whatever number of indices you make use of, set as many numbers (in such Geometrical Proportion, as is given in the question) under them.

As 1, 2, 3, 4, 5, 6, Indices.

2, 4, 8, 16, 32, 64, Numbers in Geometrical Proportion.

But if the first term in Geometrical Proportion be different from the ratio, the indices must begin with a cipher.

As 0, 1, 2, 3, 4, 5, 6, Indices.

1, 2, 4, 8, 16, 32, 64, Numbers in Geometrical Proportion.

When the Indices begin with a cipher, the sum of the indices made choice of must always be one less than the number of terms given in the question ; for 1 in the indices is over the second term, and 2 over the third, &c.

Add any two of the indices together, and that sum will agree with the product of their respective terms.

As in the first table of Indices $2+5=7$

Geometrical Proportion..... $4 \times 32 = 128$

Then the second $2+4=6$

$4 \times 16 = 64$

In any Geometrical Progression proceeding from unity, the ratio being known, to find any remote term, without producing all the intermediate terms.

RULE. Find what figures of the indices added together would give the exponent of the term wanted : then multiply the numbers standing under such exponents into each other, and it will give the term required.

NOTE. When the exponent 1 stands over the second term, the number of exponents must be one less than the number of terms.

EXAMPLES.

1. A man agrees for 12 peaches, to pay only the price of the last, reckoning a farthing for the first, and a halfpenny for the second, &c. doubling the price to the last; what must he give for them ?

Ans. £2 . 2 . 8.

$$\begin{array}{r}
 16=4 \\
 0, 1, 2, 3, 4, \text{ Exponents} \quad 16=4 \\
 1, 2, 4, 8, 16, \text{ No. of terms.} \quad \hline \\
 256=8 \\
 8=3
 \end{array}$$

$$\begin{array}{r}
 \text{For } 4+4+3=11, \text{ No. of terms less 1} \quad \hline \\
 4)2048=11 \text{ No. of far.} \quad \hline
 \end{array}$$

$$\begin{array}{r}

PART II.

VULGAR FRACTIONS.

A FRACTION is a part or parts of an unit, and written with two figures, with a line between them, as $\frac{1}{4}$, $\frac{5}{6}$, $\frac{2}{8}$, &c.

The figure above the line is called the numerator, and the under one the denominator; which shows how many parts the unit is divided into: and the numerator shows how many of those parts are meant by the fraction.

There are four sorts of vulgar fractions: proper, improper, compound, and mixed, viz.

1. A PROPER FRACTION is when the numerator is less than the denominator, as $\frac{2}{4}$, $\frac{3}{6}$, $\frac{7}{8}$, $\frac{10}{11}$, $\frac{101}{710}$, &c.

2. An IMPROPER FRACTION is when the numerator is equal to, or greater than the denominator, as $\frac{5}{3}$, $\frac{8}{4}$, $\frac{12}{12}$, $\frac{192}{2}$, &c.

3. A COMPOUND FRACTION is the fraction of a fraction, and known by the word of, as $\frac{1}{2}$ of $\frac{2}{3}$ of $\frac{7}{9}$ of $\frac{8}{17}$ of $\frac{9}{15}$, &c.

4. A MIXED NUMBER, OR FRACTION, is composed of a whole number and fraction, as $8\frac{3}{7}$, $17\frac{1}{2}$, $8\frac{71}{97}$, &c.

THE
TUTOR'S ASSISTANT.

PART III.

DECIMAL FRACTIONS.

In Decimal Fractions the integer or whole thing, as one pound, one yard, one gallon, &c. is supposed to be divided into 10 equal parts, and those parts into tenths, and so on without end.

So that the denominator of a decimal being always known to consist of an unit, with as many ciphers as the numerator has places, therefore is never set down; the parts being only distinguished from the whole members by a comma prefixed: thus ,5 which stands for $\frac{5}{10}$, ,25 for $\frac{25}{100}$, ,123 for $\frac{123}{1000}$.

But the different value of figures appears plainer by the following table.

| <i>Whole numbers.</i> | <i>Decimal parts.</i> |
|-----------------------|------------------------|
| 7 6 5 4 3 2 1 | ,2 3 4 5 6 7 |
| Units. | Parts of Millions. |
| Tens. | Parts of C. Thousands. |
| Hundreds. | Parts of X. Thousands. |
| Thousands. | Parts of Hundreds. |
| X. Thousands. | Parts of Tens. |
| C. Thousands. | |
| Millions. | |

From which it plainly appears, that as whole numbers increase in a ten-fold proportion to the left hand, so decimal parts decrease in a ten-fold proportion to the right hand; so that ciphers placed

before decimal parts decrease their value by removing them farther from the comma, or unit's place ; thus, ,5 is 5 parts of 10, or $\frac{5}{10}$; ,05 is 5 parts of 100, or $\frac{5}{100}$; ,005 is 5 parts of 1000, or $\frac{5}{1000}$; ,0005 is 5 parts of 10000, or $\frac{5}{10000}$. But ciphers after decimal parts do not alter their value. For ,5, ,50, ,500, &c. are each but $\frac{5}{10}$ of the unit.

A FINITE DECIMAL is that which ends at a certain number of places, but an INFINITE is that which no where ends.

A RECURRING DECIMAL is that wherein one or more figures are continually repeated, as 2,75222.

And 52,275275275 is called a COMPOUND RECURRING DECIMAL.

NOTE. A finite decimal may be considered as infinite, by making ciphers to recur; for they do not alter the value of the decimal.

In all operations, if the result consists of several nines, reject them, and make the next superior place an unit more; thus, for 26,25999, write 26, 26.

In all circulating numbers, dash the last figure.

ADDITION OF DECIMALS.

RULE. In setting down the proposed numbers to be added, great care must be taken in placing every figure directly underneath those of the same value, whether they be mixed numbers, or pure decimal parts; and to perform which there must be a due regard had to the commas, or separating points, which ought always to stand in a direct line, one under another, and to the right hand of them carefully place the decimal parts according to their respective values; then add them as in whole numbers.

EXAMPLES.

1. Add $72,5 + 32,071 + 2,1574 + 371,4 + 2,75$.
Facit, 480,8784.
2. Add $30,07 + 2,0071 + 59,432 + 7,1$.
3. Add $3,5 + 47,25 + 927,01 + 2,0073 + 1,5$.
4. Add $52,75 + 47,21 + 724 + 31,452 + 3075$.
5. Add $3275 + 27,514 + 1,005 + 725 + 7,32$.
6. Add $27,5 + 52 + 3,2675 + 5741 + 2720$.

SUBTRACTION OF DECIMALS.

RULE. Subtraction of decimals differs but little from whole numbers, only in placing the numbers, which must be carefully observed, as in addition.

EXAMPLES.

- | | |
|-----------------------------|----------------------------|
| 1. From ,2754 take ,2371. | 5. From 571 take 54,72. |
| 2. From ,237 take 1,76. | 6. From 625 take 76,91. |
| 3. From 271 take 215,7. | 7. From 23,415 take ,3742. |
| 4. From 270,2 take 75,4075. | 8. From ,107 take ,0007. |

MULTIPLICATION OF DECIMALS.

RULE. Place the factors, and multiply them, as in whole numbers, and from the product towards the right hand, cut off as many places for decimals as there are in both factors together; but if there should not be so many places in the product, supply the defect with ciphers to the left hand.

EXAMPLES.

- | | |
|-----------------------------|-------------------------------|
| 1. Multiply ,2365 by ,2435. | Facit, ,05758775. |
| 2. Multiply 2071 by 2,27. | 7. Multiply 27,35 by 7,70071. |
| 3. Multiply 27,15 by 25,3. | 8. Multiply 57,21 by ,0075. |
| 4. Multiply 72347 by 23,15. | 9. Multiply ,007 by ,007. |
| 5. Multiply 17105 by ,3257. | 10. Multiply 20,15 by ,2705. |
| 6. Multiply 17105 by ,0237. | 11. Multiply ,907 by ,0025. |

When any number of decimals is to be multiplied by 10, 100, 1000, &c., it is only removing the separating point in the multiplicand so many places towards the right hand as there are ciphers in the multiplier: thus, $.578 \times 10 = 5,78$. $.578 \times 100 = 5,78$. $.578 \times 1000 = 578$; and $.578 \times 10000 = 5780$.

CONTRACTED MULTIPLICATION OF DECIMALS.

RULE. Put the unit's place of the multiplier under that place of the multiplicand that is intended to be kept in the product, then invert the order of all the other figures. i. e. write them all the

contrary way ; and in multiplying, begin at the figure in the multiplicand, which stands over the figure you are then multiplying with, and set down the first figure of each particular product directly one under the other, and have a due regard to the increase arising from the figures on the right hand of that figure you begin to multiply at in the multiplicand.

NOTE. That in multiplying the figure left out every time next the right hand in the multiplicand, and if the product be 5, or upwards, to 15, carry 1 ; if 15, or upwards, to 25, carry 2 ; and if 25, or upwards, to 35, carry 3, &c.

EXAMPLES.

12. Multiply 384,672158 by 36,8345, and let there be only four places of decimals in the product.

| Contracted way. | Common way. |
|-----------------|--------------------|
| 384,672158 | 384,672158 |

| 14169,2065 | 14169,2066 038510 |
| | Facit, 14169,2065. |

13. Multiply 3,141592 by 52,7438, and leave only four places of decimals.
Facit, 165,6994.

14. Multiply 2,38645 by 8,2175; and leave only four places of decimals.
Facit, 19,6107.

15. Multiply 375,13758 by 167324, and let there be only one place of decimals.
Facit, 6276,9.

16. Multiply 375,13758 by 16,7324, and leave only four places of decimals.
Facit, 6276,9520.

17. Multiply 395,3756 by ,75642, and let there be only four places of decimals.
Facit, 299,0699.

DIVISION OF DECIMALS.

THIS Rule is also worked as in whole numbers ; the only difficulty is in valuing the quotient, which is done by any of the following rules :

RULE 1. The first figure in the quotient is always of the same value with that figure of the dividend, which answers or stands over the place of units in the divisor.

2. The quotient must always have so many decimal places, as the dividend has more than the divisor.

NOTE 1. If the divisor and dividend have both the same number of decimal parts, the quotient will be a whole number.

2. If the dividend hath not so many places of decimals as are in the divisor, then so many ciphers must be annexed to the dividend as will make them equal, and the quotient will then be a whole number.

3. But if, when the division is done, the quotient has not so many figures as it should have places of decimals, then so many ciphers must be prefixed as there are places wanting.

EXAMPLES.

| | |
|-------------------------------|-------------------------------|
| 1. Divide 85643,825 by 6,321. | Facit 13549. |
| 2. Divide 48 by 144. | 7. Divide 7382,54 by 6,4252. |
| 3. Divide 217,75 by 65. | 8. Divide ,0851648 by 423. |
| 4. Divide 125 by ,1045. | 9. Divide 267,15975 by 13,25. |
| 5. Divide 709 by 2,574. | 10. Divide 72,1564 by ,1347. |
| 6. Divide 5,714 by 8275. | 11. Divide 715 by ,3075. |

When numbers are to be divided by 10, 100, 1000, 10,000, &c. it is performed by placing the separating point in the dividend so many places towards the left hand, as there are ciphers in the divisor.

$$\text{Thus, } 5784 \div 10 = 578,4.$$

$$5784 \div 100 = 57,84.$$

$$5784 \div 1000 = 5,784.$$

$$5784 \div 10,000 = ,5784.$$

CONTRACTED DIVISION OF DECIMALS.

RULE. By the first rule find what is the value of the first figure in the quotient : then by knowing the first figure's denomination, the decimal places may be reduced to any number, by taking as many of the left hand figures of the dividend as will answer them ; and in dividing, omit one figure of the divisor at each following operation.

NOTE. That in multiplying every figure left out in the divisor, you must carry 1, if it be 5 or upwards, to 15 ; if 15, or upwards, to 25, carry 2 ; if 25, or upwards, to 35, carry 3, &c.

EXAMPLES.

12. Divide 721,17562 by 2,257432, and let there be only three places of decimals in the quotient.

REDUCTION OF DECIMALS.

To reduce a Vulgar Fraction to a Decimal.

NOTE. If the given parts are of several denominations, they may be reduced either by so many distinct operations as there are different parts, or by first reducing them into their lowest denomination, and then divide as before; or,

2ndly. Bring the lowest into decimals of the next superior denomination, and on the right hand of the decimal found, place the parts given of the next superior denomination; so proceeding till you bring out the decimal parts of the highest integer required, by still dividing the product by the next superior denominator; or,

3dly. To reduce shillings, pence, and farthings. If the number of shillings be even, take half for the first place of decimals, and let the second and third places be filled with the farthings contained in the remaining pence and farthings, always remembering to add 1, when the number is, or exceeds 25. But if the number of shillings be odd, the second place of decimals must be increased by 5.

EXTRACTION OF THE SQUARE ROOT.

Extracting the Square Root is to find out such a number as, being multiplied into itself, the product will be equal to the given number.

RULE. First, Point the given number, beginning at the unit's place, then proceed to the hundreds, and so upon every second figure throughout.

Secondly. Seek the greatest square number in the first point towards the left hand, placing the square number under the first point, and the root thereof in the quotient; subtract the square number from the first point, and to the remainder bring down the next point and call that the resolvend.

Thirdly. Double the quotient, and place it for a divisor on the left hand of the resolvend; seek how often the divisor is contained in the resolvend; (preserving always the unit's place) and put the answer in the quotient, and also on the right-hand side of the divisor; then multiply by the figure last put in the quotient, and subtract the product from the resolvend; bring down the next point to the remainder (if there be any more) and proceed as before.

To extract the Square Root of a mixed number.

RULE. Reduce the fractional part of a mixed number to its lowest term, and then the mixed number to an improper fraction.

RULE FOR MULTIPLYING DUODECIMALLY.

1. Under the multiplicand write the corresponding denominations of the multiplier.
2. Multiply each term in the multiplicand (beginning at the lowest) by the feet in the multiplier; write each result under its respective term, observing to carry an unit for every 12, from each lower denomination to its next superior.
3. In the same manner multiply the multiplicand by the primes in the multiplier, and write the result of each term one place more to the right hand of those in the multiplicand.

2. Painting, plastering, paving, &c. by the yard.
3. Partitioning, flooring, roofing, tiling, &c. by the square of 100 feet.

Ans. £1 : 18 : 9.

21. There are 8 windows to be glazed, each measures 1 foot 6 inches wide, and 3 feet in height, how much will they come to at 7 $\frac{3}{4}$ d. per foot ?

Ans. £1 : 3 : 3.

22. What is the price of a marble slab, whose length is 5 feet 7 inches, and the breadth 1 foot 10 inches, at 6s. per foot ?

Ans. £3 : 1 : 5.

Measuring by the Yard Square, as Paviers, Painters, Plasterers, and Joiners.

NOTE. Divide the square feet by 9, and it will give the number of square yards.

EXAMPLES.

23. A room is to be ceiled, whose length is 74 feet 9 inches, and width 11 feet 6 inches ; what will it come to at 3s. 10 $\frac{1}{2}$ d. per yard ?

Ans. £18 : 10 : 1.

24. What will the paving of a court-yard come to at 4 $\frac{3}{4}$ d. per yard, the length being 58 feet 6 inches, and breadth 54 feet 9 inches ?

Ans. £7 : 0 : 10.

25. A room was painted 97 feet 8 inches about, and 9 feet 10 inches high, what does it come to at 2s. 8 $\frac{1}{4}$ d. per yard ?

Ans. £14 : 11 : 1 $\frac{1}{2}$.

26. What is the content of a piece of wainscoting in yards square, that is 8 feet 3 inches long, and 6 feet 6 inches broad, and what will it come to at 6s. 7 $\frac{1}{2}$ d. per yard ?

Ans. Contents, yards 5.8.7.6; comes to £1 : 19 : 5.

27. What will the paving of a court-yard come to at 3s. 2d. per yard, if the length be 27 feet 10 inches, and the breadth 14 feet 9 inches ?

Ans. £7 : 4 : 5.

28. A person has paved a court-yard 42 feet 9 inches in front, and 68 feet 6 inches in depth, and in this he laid a foot-way the depth of the court, of 5 feet 6 inches in breadth ; the foot way is laid with Purbeck stone, at 3s. 6d. per yard, and the rest with pebbles, at 3s. per yard ; what will the whole come to ?

Ans. £49 : 17.

29. What will the plastering of a ceiling, at 10d. per yard, come to, supposing the length 31 feet 8 inches, and the breadth 14 feet 10 inches ?

Ans. £1 : 9 : 9.

30. What will the wainscoting of a room come to at 6s. per square yard, supposing the height of the room (taking in the cornice and moulding) is 12 feet 6 inches, and the compass 83 feet 8 inches, the three window shutters each 7 feet 8 inches by 3 feet 6 inches, and the door 7 feet by 3 feet 6 inches ? The shutters and door being worked on both sides, are reckoned work and half work.

Ans. £36 : 12 : 2 $\frac{1}{2}$.

Measuring by the Square of 100 feet, as Flooring, Partitioning, Roofing, Tiling, &c.

EXAMPLES.

31. In 173 feet 10 inches in length, and 10 feet 7 inches in height of partitioning, how many squares?

Ans. 18 squares, 39 feet, 8 inches, 10 p.

32. If a house of three stories, besides the ground floor, was to be floored at £6 : 10 per square, and the house measured 20 feet 8 inches, by 16 feet 9 inches ; there are 7 fire-places, whose measures are, two of 6 feet by 4 feet 6 inches each, two of 6 feet by 5 feet 4 inches each, and two of 5 feet 8 inches by 4 feet 8 inches each, and the seventh of 5 feet 2 inches by 4 feet, and the well hole for the stairs is 10 feet 6 inches by 8 feet 9 inches : what will the whole come to ?

Ans. £53 : 13 : 3 $\frac{1}{2}$.

33. If a house measures within the walls 52 feet 8 inches in length, and 30 feet 6 inches in breadth, and the roof be of a true pitch, what will it come to roofing at 10s. 6d. per square ?

Ans. £12 : 12 : 11 $\frac{3}{4}$.

NOTE. In tiling, roofing, and slating, it is customary to reckon the flat and half of the building within the wall, to be the measure of the roof of that building, when the said roof is of a true pitch, i. e. when the rafters are $\frac{1}{2}$ of the breadth of the building ; but if the roof is more or less than the true pitch, they measure from one side to the other with a rod or string.

34. What will the tiling of a barn cost, at 25s. 6d. per square ; the length being 43 feet 10 inches, and breadth 27 feet 5 inches on the flat, the eave boards projecting 16 inches on each side ?

Ans. £24 : 9 : 5 $\frac{1}{4}$.

Measuring by the Rod.

NOTE. Bricklayers always value their work at the rate of a brick and a half thick ; and if the thickness of the wall is more or less, it must be reduced to that thickness by this

RULE. Multiply the area of the wall by the number of half bricks in the thickness of the wall ; the product divided by 3, gives the area.

EXAMPLES.

35. If the area of a wall be 4085 feet, and the thickness two bricks and a half, how many rods doth it contain ?

Ans. 25 rods, 8 feet.

36 If a garden wall be 254 feet round, and 12 feet 7 inches high, and 3 bricks thick, how many rods doth it contain ?

38. If the side walls of a house be 28 feet 10 inches in length, and the height of the roof from the ground 55 feet 8 inches, and the gable (or triangular part at top) to rise 42 course of bricks, reckoning 4 course to a foot. Now, 20 feet high is $2\frac{1}{2}$ bricks thick, 20 feet more at two bricks thick, 15 feet 8 inches more at $1\frac{1}{2}$ brick thick, and the gable at 1 brick thick ; what will the whole work come to at £5 16s. per rod ?

Ans. £48 : 13 : 5 $\frac{1}{2}$

Multiplying several figures by several, and the product to be produced in one line only.

RULE. Multiply the units of the multiplicand by the units of the multiplier, setting down the units of the product, and carry the tens ; next multiply the tens in the multiplicand by the units of the multiplier, to which add the product of the units of the multiplicand multiplied by the tens in the multiplier, and the tens carried ; then multiply the hundreds in the multiplicand by the units of the multiplier, adding the product of the tens in the multiplicand multiplied by the tens in the multiplier, and the units of the multiplicand by the hundreds in the multiplier ; and so proceed till you have multiplied the multiplicand all through, by every figure of the multiplier.

EXPLANATION.

First, $4 \times 4 = 16$, that is 6 and carry one. Secondly, $3 \times 4 + 4 \times 2$, and 1 that is carried, is 21—set down 1 and carry 2. Thirdly, $2 \times 4 + 3 \times 2 + 4 \times 4 + 2$ carried = 32, that is 2 and carry 3. Fourthly, $5 \times 4 + 2 \times 2 + 3 \times 4 + 4 \times 2 + 3$ carried = 47, set down 7 and carry 4. Fifthly, $3 \times 4 + 5 \times 2 + 2 \times 4 + 3 \times 2 + 4 \times 5 + 4$ carried = 60, set down 0 and carry 6. Sixthly, $3 \times 2 + 5 \times 4 + 2 \times 2 + 3 \times 5 + 6$ carried = 51, set down 1 and carry 5. Seventhly, $3 \times 4 + 5 \times 2 + 2 \times 5 + 5$ carried = 37, that is 7 and carry 3. Eighthly, $3 \times 2 + 5 \times 5 + 3$ carried = 34, set down 4 and carry 3. Lastly, $3 \times 5 + 3$ carried = 18, which being multiplied by the last figure in the multiplier, set the whole down, and the work is finished.

**A COMPENDIUM OF BOOK-KEEPING.
BY SINGLE ENTRY.**

BOOK-KEEPING is the art of recording the transactions of persons in business so as to exhibit a state of their affairs in a concise and satisfactory manner.

Books may be kept either by *Single* or by *Double Entry*, but *Single Entry* is the method chiefly used in retail business.

The books found most expedient in Single Entry, are the *Day-Book*, the *Cash-Book*, the *Ledger*, and the *Bill-Book*.

The Day-Book begins with an account of the trader's property, debts, &c. ; and are entered in the order of their occurrence, the daily transactions of goods bought and sold.

The Cash-Book is a register of all money transactions. On the left-hand page, *Cash* is made *Debtor* to all sums received ; and on the right, *Cash* is made *Creditor* by all sums paid.

The Ledger collects together the scattered accounts in the Day-Book and Cash-Book, and places the Debtors and Creditors upon opposite pages of the same folio ; and a reference is made to the folio of the books from which the respective accounts are extracted, by figures placed in a column against the sums. References are also made in the Day-Book and Cash-Book, to the folios in the Ledger, where the amounts are collected. This process is called *posting*, and the following general rule should be remembered by the learner, when engaged in transferring the register of mercantile proceedings from the previous books to the Ledger :

The person from whom you purchase goods, or from whom you receive money, is *Creditor* ; and, on the contrary, the person to whom you sell goods, or to whom you pay money, is *Debtor*.

In the Bill-Book are inserted the particulars of all *Bills of Exchange* ; and it is sometimes found expedient to keep for this purpose two books, into one of which are copied *Bills Receivable*, or such as come into the tradesman's possession, and are drawn upon some other person ; in the other book are entered *Bills Payable*, which are those that are drawn upon and accepted by the tradesman himself.
